

Are you between the ages of 18-30 and currently living with a visual impairment?

If the answer to both of these questions is yes, your assistance is requested. "Self-Concept and Motivation in the Visually Impaired/Blind" is a qualitative study being conducted at Crandall University in Moncton, NB. This study aims to understand better the experience of having a visual impairment/blindness in emerging adulthood, specifically how it impacts the self-concept and motivation.

This study will use a qualitative interview questionnaire asking questions that pertain to the individual's self-concept and motivation. The interviews will be conducted with participants individually. This process will be completed in person, or over video-chat and is expected to be one hour in length. Informed consent will be obtained before the beginning of the interviews, and as participation is voluntary, consent may be withdrawn at any time. Information collected for this study will include no identifiable information, such as names, or dates of birth, etc. Data will be kept on a password-protected computer, accessible only by the primary researcher.

Your participation would be much appreciated in helping make this research a success. For further questions or if interested, individuals can contact the primary researcher, Alisha Longmire at [longmireali@crandalluniversity.ca](mailto:longmireali@crandalluniversity.ca) or by calling 1-902-526-0458.
